

INNOMEDIA

ESBC 9328-4B

ENTERPRISE SESSION BORDER CONTROLLER

HIGHLY INTEGRATED ESBC IDEAL FOR BROADBAND SERVICE PROVIDERS OFFERING SIP TRUNKING SERVICES

Designed for Service Providers offering SIP trunking and high-speed Gigabit data services, InnoMedia's ESBC 9328-4B is a highly integrated and highly manageable Enterprise Session Border Controller (ESBC) that can be auto-provisioned and remotely managed. It is ideally suitable for wide deployment by broadband service providers addressing SIP-PBX interoperability for SIP Trunking as well as providing simple NAT Traversal for Hosted PBX Services.

Key Benefits

A clear demarcation solution for broadband service providers to deliver SIP trunking, hosted voice, and broadband internet services to business customers with IP-PBX and IP-Phones

SIP trunking features and capabilities

- B2BUA
- SIP registrar server
- SIP normalization for IP-PBX interoperability
- NAT traversal for SIP messages
- Special call handling and SIP Normalization for Emergency Calls

SIP ALG/Proxy

- Allowing authorized non-SIP trunk SIP traffic
- NAT traversal with minimal configuration

Gigabit Bridged/pass-through port

- Bridged to the Gigabit WAN port
- For service provider to deliver high-speed data services

Stateful Inspection

- SIP-aware, access control
- Stateful packet inspection, IDS/IPS

Monitoring features including Test Call Agent, Calculated MOS Scores for every call, CDR, real-time UA & SIP trunk call states, SIP call trace, battery status, and packet loopback for server-based voice quality monitoring

Business environment friendly

- PBX (Ground start/Loop start & OSI)
- FAX (T.38 and G.711 fallback)
- House wiring with foreign voltage detection
- Credit card reader transaction

Security

- TLS for signaling
- Stateful Inspection, IDS/IPS
- Access control

A stateful inspection with IDS/IPS is placed in front of the FXS ports, the SIP trunk traffic path, as well as the non-SIP Trunk SIP traffic path to protect these paths from unauthorized access or attacks. The high-speed data path is not protected by the firewall as it is assumed that this path is connected to the enterprise firewall which has its protection policy.

The SIP trunk path provides SIP normalization, NAT traversal, topology hiding, and security for Service Providers offering SIP trunking service to enterprise customers with diverse IPPBX and network configurations. It includes B2BUA for SIP normalization, a Registrar for User Agent (UA) registration, TLS block for secured signaling, and NAT traversal for proper SDP address correction. The UA (e.g., IPPBX) registers to and communicates with the ESBC which terminates UA traffic and re-initiates normalized SIP packets to communicate with the Service Provider's network servers.

The SIP ALG path enables Service Providers to offer Hosted PBX Services with NAT traversal, TLS security for signaling,

and header manipulation. It allows SIP packets of registered UAs (e.g., IP Phones) to traverse through to communicate with the network servers. The UAs register to the designated network servers, and point to the ESBC as the default gateway.

The bridge path is a transparent pass-through port, allowing uninterrupted high-speed data to go through. It is intended for Service Providers to offer high-speed data services.

The ESBC 9328-4B, located at the edge of the HFC access networks, can be managed by the Service Provider with secured HTTP-based auto-provisioning and SNMP-based remote management. It offers an ideal demarcation between the Service Provider and its enterprise customers.

Delivering Scalable QoS Managed SIP Trunking, Hosted Voice, and High-Speed Data Services

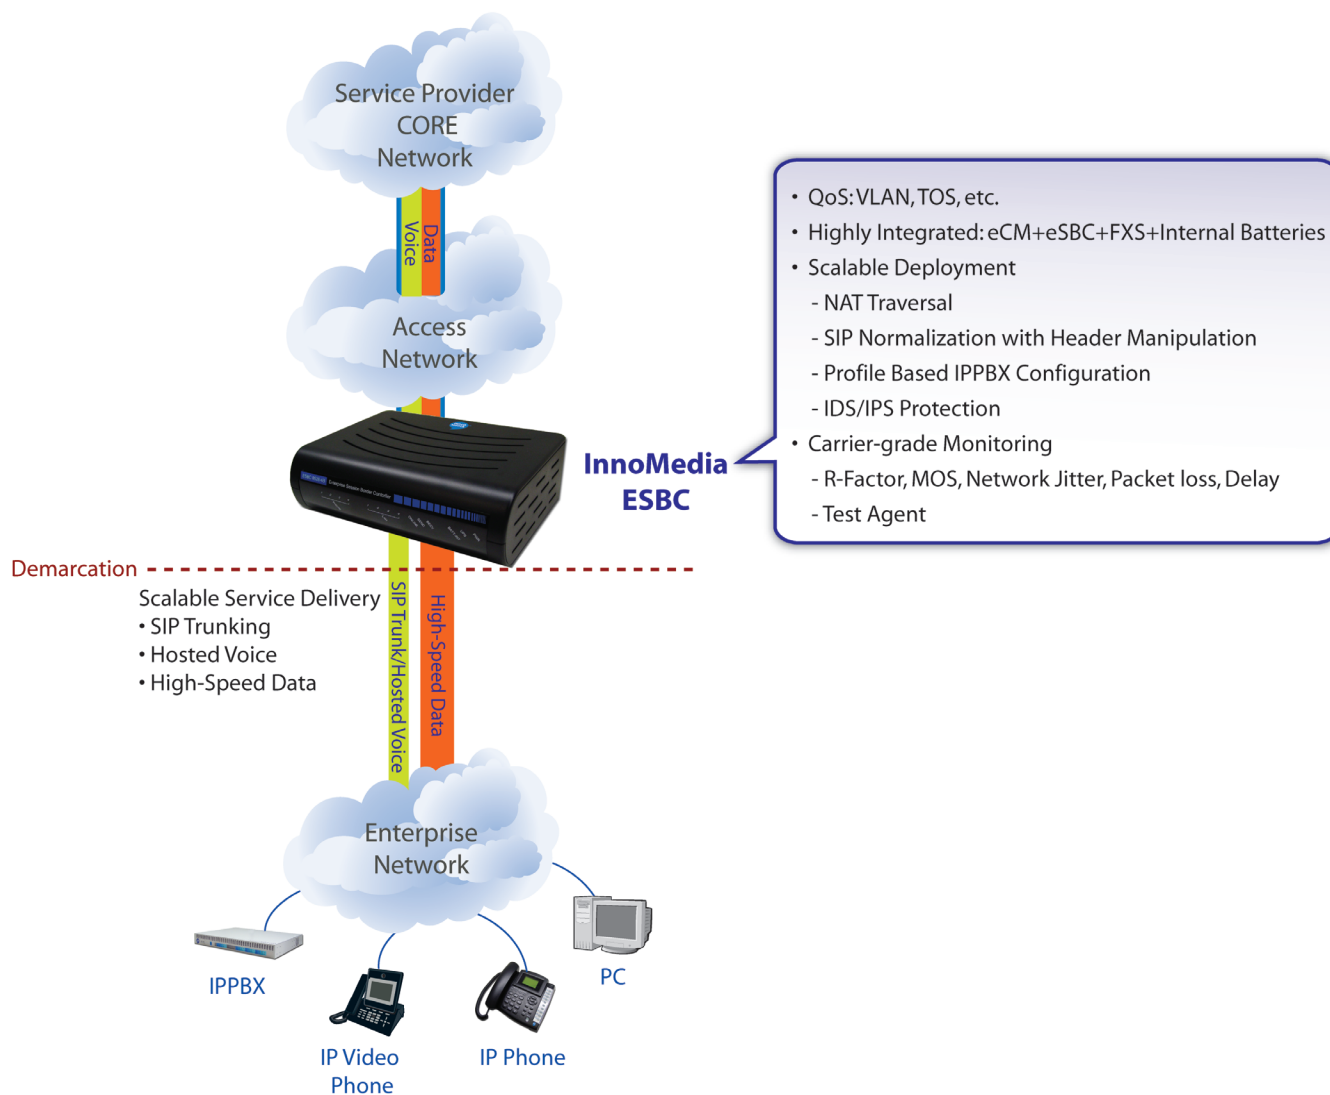

Figure 1

The highly integrated ESBC 9328-4B includes the following key functional blocks:

1. Intelligent internal battery as well as external UPS support
2. Four FXS ports with business friendly features
3. eSBC function supporting Service Provider's SIP trunk business
4. SIP ALG for hosted voice SIP traffic
5. Bridge/pass-through port for Service Provider's high-speed data services
6. Stateful inspection protecting the eSBC, FXS, and the SIP Proxy/ALG path
7. Voice and network Monitoring

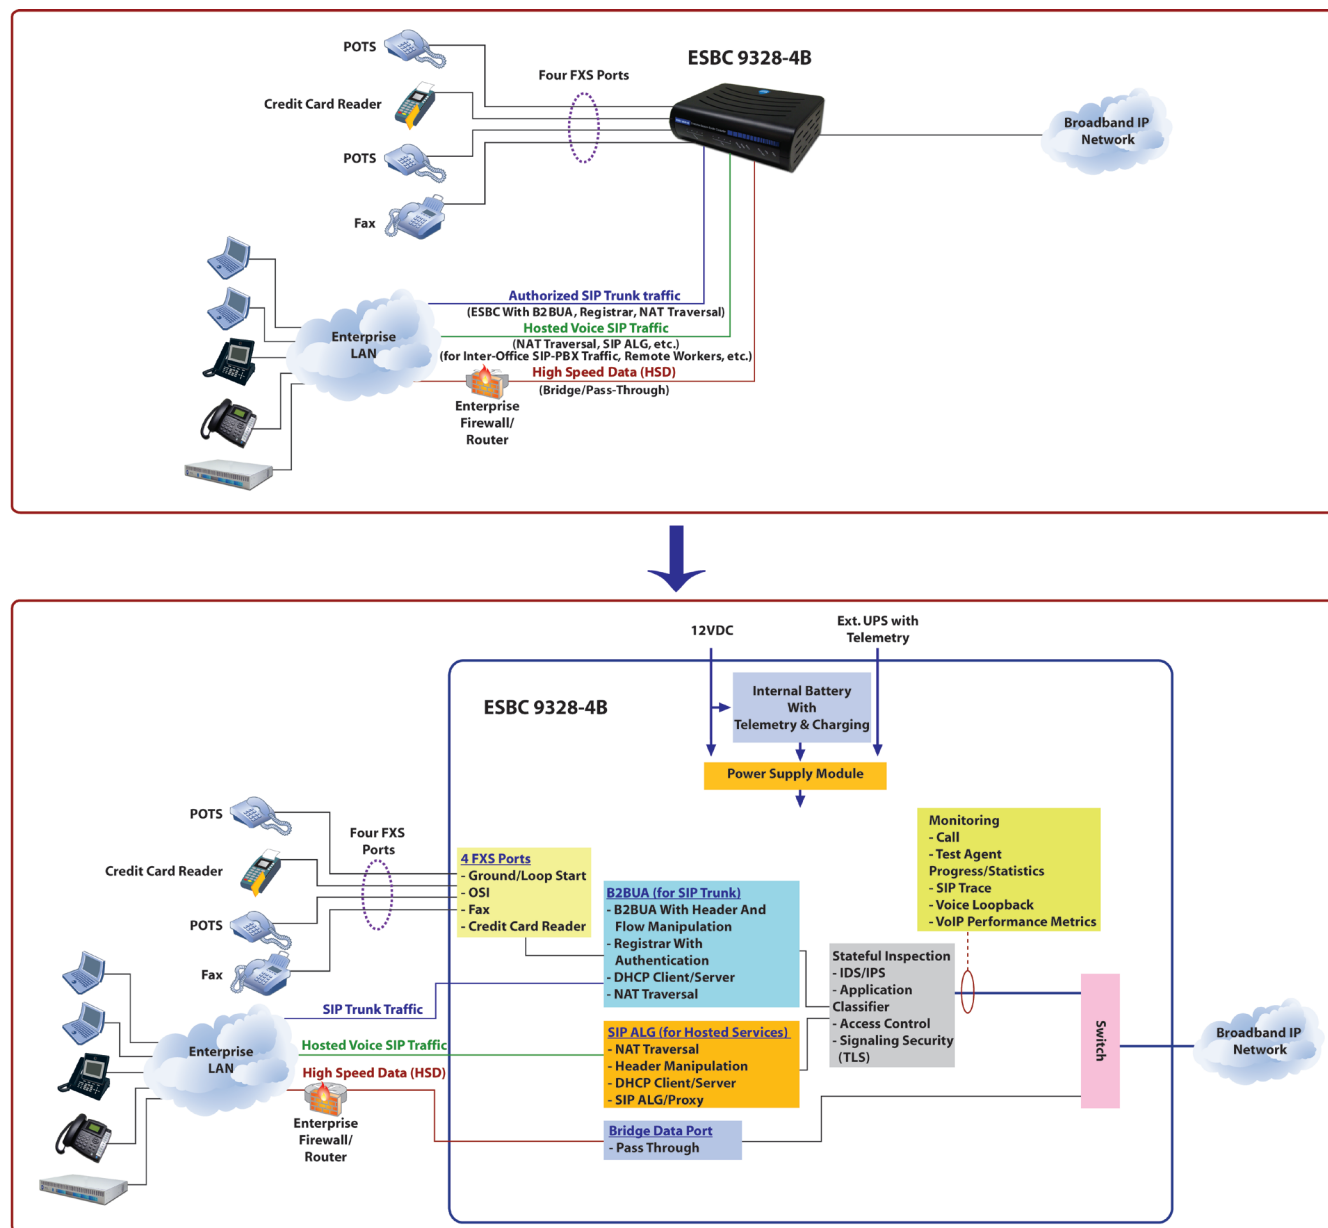

Figure 2

Integrated Internal Battery As Well As External UPS Support

The ESBC 9328-4B is equipped with an internal battery supporting up to 4 hours of continuous talk time for all 4 telephone lines, or up to 8 hours of standby time. It also has a UPS port to connect to external UPS batteries to allow service provider to offer primary line voice services. An Internal and External Battery LED as well as SNMP traps for remote monitoring indicates when the internal or external battery is in-use, charging, fully charged, faulty, or bad.

Four FXS Ports With Business Friendly Features

InnoMedia's ESBC 9328-4B includes 4 voice ports that deliver revenue generating telephony services to their enterprise customers. It has rich set of business features including ground start/loop start and OSI for business PBX's, foreign voltage detection to allow house wiring and prevent accidental connection of house wires to live PSTN, T.38 and G.711 fallback fax support, reliable Bell103/212A modem transmission for credit card reader information transaction, and RJ11 DC open loop for loss of voice link indication to allow alarm triggering.

eSBC Function Supporting Service Provider's SIP Trunk Business

Using B2BUA, the ESBC 9328-4B supports the key functions needed by the Service Providers to offer reliable and scalable SIP trunk services to their enterprise customers. It supports up to 50 simultaneous B2BUA sessions. The key functions that are supported by the ESBC 9328-4B include:

1. SIP Normalization:

Based on the B2BUA architecture, InnoMedia's ESBC 9328-4B provides Profile based settings, High-level classification for SIPConnect Adaptation, and Low-level header manipulation for SIP signaling normalization:

– Profile based settings:

ESBC 9328-4B allows parameter and option settings to adapt between the two interfaces: the WAN interface to the Service Provider servers, and the LAN interface to the UA/SIP-PBXs. The settings are stored as SIP Trunk profiles and the UA/SIP-PBX profiles respectively for selection.

- For each SIP-PBX, the settings are captured in a UA/SIP-PBX specific Profile. Thus, an SI only needs to choose the profile corresponding to the specific SIP-PBX for easy system setup (see Figure 3).
- Based on the Service Provider's network servers, the parameters/options are captured in the corresponding SIP Trunk profile (see Figure 4).

The SIP normalization and adaptation mechanisms are:

– High-level classification for SIPConnect Adaptation (see Figure 4):

- Adapts between non-SIPConnect-compliant UA/SIP-PBXs and Service Provider's Servers which are compliant or non-compliant to SIPConnect
- Adaptation includes Registration (takes care of different forms of registration, e.g., Implicit, explicit, static/no registration), Security (TLS, SIP Digest), TCP versus UDP for SIP message transport, Redirect Handling (Out-of-dialog Diversion, 3xx, REFER, etc.), URI Formatting, Anonymous calls, and others.

– Low-level header manipulation for fine-grain adjustment (see Figure 3)

- Selectable header manipulation options, examples:
 - Remove headers in 180 responses, Remove RFC 2543 Hold, Strip ICE attributes, Loose routing, Expires header, Loose Username check, Force Remote TLS connection reuse, etc.

2. Registration and Authentication:

Acting as a registrar server to SIP-PBXs, the InnoMedia ESBC 9328-4B supports the following SIP-PBX registration methods:

- a) Implicit registration – SIP-PBX with Dynamic or Static IP address sends registration of the Parent Number
- b) Explicit registration – SIP-PBX with Dynamic or Static IP address sends registration of all SIP User Accounts
- c) Static registration – SIP-PBX with Dynamic or Static IP address does not send any registration messages.

3. NAT Traversal:

- Inspects and modifies headers, SDP, and implement media relay via RTP bridge control.

4. SIP signaling security:

- TLS: ESBC 9328-4B supports TLS connection with the Service Provider network (authenticate Service Provider servers) for secured signaling transport, as well as SIP Digest authentication (challenged and authenticated by the Service Provider servers).
- SIP Message Validation: ESBC 9328-4B validates all SIP messages

5. Emergency Call Handling

- Special call handling and SIP header manipulations for emergency calls
- Line Preemption to always allow emergency calls regardless of session limits
- Media manipulation to force CODEC and disabling voice activity detection
- Overriding caller ID and caller name information

Bridge/Pass-Through Port For Service Provider's High-Speed Data Services

The ESBC 9328-4B allows one of its LAN ports to be configured as a bridge to its WAN interface. This bridge port can be used by the Service Provider to offer high speed data services. The Service Provider can deliver global IP addresses to its enterprise customers who can connect this bridge port to the enterprise firewall.

SIP ALG For Hosted Voice SIP Traffic

The SIP Proxy/ALG path can be used for authorized non-SIP trunk SIP traffic. It will only allow SIP traffic from specific registered and authenticated devices to come in. This path can be used for devices that connect to Hosted PBX services.

Stateful Inspection

A stateful inspection with IDS/IPS can be enabled or disabled for the FXS ports, the SIP trunk traffic path, as well as the Non-SIP Trunk SIP traffic path to protect these paths from unauthorized access or attacks. The bridged/pass-through port is not protected by the firewall, and is typically connected to the enterprise firewall which has its protection policy.

Monitoring

The monitoring features including CDR, real-time UA & SIP trunk call states, SIP Call Trace, battery status, packet loopback for server-based Voice Quality Monitoring, R-Factor and MOS calculation for every call, and SNMP Traps based on thresholds of network call parameters. The ESBC also works in conjunction with InnoMedia's DMS Server for monitoring and analysis of MOS scores, Data Network Traffic and CDR information.

UA/SIP-PBX PROFILE

Profile Configuration (Cisco UC500)

Configure SIP parameters for SIP terminal.

Profile ID: Cisco UC500

SIP Parameters

	<input type="checkbox"/> Enable Static Registration
	<input type="checkbox"/> Use TCP Transport for SIP Messages
Timer Invite Expires	180 secs (Default:180)
Timer 1xx Retransmission	60 secs (Default:60)

Interoperability

Country Code	(This will be added or removed in the From and Contact headers)
Set URI format of Header	'From' not E.164, without user=phone 'To' not E.164, without user=phone
Set Identity header for calls to SIP terminal	NONE
Anonymous call	Set From header to: "Anonymous" <sip:anonymous@[domain]>
Get Caller ID from SIP Header if exists	<input checked="" type="checkbox"/> P-Preferred-Identity <input checked="" type="checkbox"/> P-Asserted-Identity <input checked="" type="checkbox"/> Remote-Party-ID
